Residential houses at Sered' could be heated from geothermal sources. "In the 1st stage we want heating one housing development with 780 apartments, in the 2nd phase we would connect it with the second approximately as large as the first housing development, "said R. Chatrnúch from the Municipal Housing Company, Sered'. "We could also use the geothermal borehole for recreational purposes, such as a smaller thermal pool. However, we do not plan a water park; they are enough of them in the surrounding, "said P. Rampašek, the vice-major of Sered'. The geothermal borehole will be located near Dolná Streda village. Its depth should be 1.6 to 1.8 km and the water temperature 56-60 °
